

Dispatching Actions

To dispatch an action and update the state, call the **dispatch** method on your store and pass in the action as an argument.

```
store.dispatch(addTodo( 'Learn Redux' ));
```

Connecting to React Components

To connect your Redux store to React components, use the **connect** function from the **react-redux** library.

```
import { connect } from 'react-redux';

const TodoList = ({ todos }) => (
  <ul>
    {todos.map((todo, index) => (
      <li key={index}>{todo.text}</li>
    ))}
  </ul>
);

const mapStateToProps = (state) => {
  return {
    todos: state.todos
  };
};

export default
connect(mapStateToProps)(TodoList);
```
